Practical 1

Zheng Zhaoheng

1. I have found 4 expressions that can extract the second column from the given Tensor t:

   ```
   local t = torch.Tensor({{1,2,3},{4,5,6},{7,8,9}})
   ```

   They are shown below:

   ```
   col = t:transpose(1,2)[2]
   col = t:split(1,2)[2]
   col = t:select(2,2)
   col = t:sub(1,3,2,2)
   ```

2. Tensor is a particular way of viewing a Storage: a Storage only represents a chunk of memory, while the Tensor interprets this chunk of memory as having dimensions.
